

Peak location shifts monotonically $0.60 \rightarrow 0.95$ across $h \in [0.01, 0.15]$; only $h = 0.01$ gives a positive peak eigenvalue on this simplified pipeline (3344-cell MET subset, 1000 epochs). Any timing claim should be checked against a bandwidth sweep on the exact same pipeline.

A | Peak τ vs bandwidth**B | Peak $\text{Re}(\lambda_{\text{max}})$ vs bandwidth
(only $h \approx 0.01$ gives a positive peak eigenvalue)**
